

ROOFED CALF BOXES

We would like to offer our customers individual calf pens which are designed for outdoor use. Our calf boxes are composed of a strong, durable, high-quality steel structure which is filled with PVC planks. Floor is made of micro-mesh, fiberglass reinforced plastic (FRP) grating with slip resistant surface. Exterior walls are made of covered walls to prevent draught. Front doors are divided into two parts, each part is equipped with one metal ring for a feed container and one holder for a bucket with milk. Additionally, our calf box has little windows made out of polycarbonate sheets which can be opened in hot days. The whole structure is roofed with isolated sandwich panels, which is so extended to cover the containers with food and allow work during rainy days. Such calf housing systems can be easily transportable by means of a fork lift. Additionally, the calf box has a swing floor, which allows for an easy dung removal. Calf box dimensions are 1,8 m x 1,2 m. Our roofed calf system meets the Animal Protection Act and Welfare Standards. It is designed to improve hygienic and living conditions of farm animals and helps to keep disease-susceptible young calves healthy. Top light and fresh air access guarantees optimal start into adult life.
