Cow Cleaning Machines

Employees during assembly in Buchbach, Germany.

Improved animal health
Cows need to scour and scrape. Cow Cleaning Machines are an important part of general hygiene and no modern pen should be without one. Cattle clean themselves and rid themselves of lice, mites and other parasites. The development of eczema or fungal infections is reduced or even generally prevented. When animals are healthy, then you have a calm, relaxed herd.

Improved yield
Healthy and cared-for cattle can achieve improved yields because the feeling of well-being is an important factor. The large-area brushes and massaging action increases blood supply to the skin, promotes heat dissipation and stimulates the metabolism. The stimulated blood circulation can increase milk yields and increase the frequency of "in-heat" periods.

Easy assembly
Our electric Cow Cleaning Machines are easy to install and nearly maintenance-free. The lubrication of pressure points and the prompt replacement of brush rollers extend service life and attractiveness to animals. The devices are suitable for outside installation, e.g. under a projecting roof.

You can improve the yield and well-being of your cattle with the Cow Cleaning Machine from KERBL.

The cow is cleaned on the head, neck, back, torso and side.

The head and torso are thoroughly cleaned due to the vertical, oscillating shape.

The back, tail and torso as well as the head are brushed thanks to the diagonal, conical arrangement.

Cow Cleaning Machine HAPPYCOW Duo

The animals brush and massage themselves extensively via the fully-automatic Cow Cleaning Machine. The 2-brush system enables large-area cleaning and the cattle are clearly happy with it.

With the newly developed electronics, we ensure disruption-free and maintenance-free operation. The HAPPYCOW Duo is also equipped with an intelligent control and display system. The high-quality brushes are worn down evenly due to the alternating direction of brush movement. The brush run time (7.5 - 120 sec.) can be set individually. A sensor prevents tail hair from getting pulled in and turns the device off automatically. The optimised brush stabiliser weight ensures that animals are happy to use them. The Cow Cleaning Machine was designed for the toughest pen conditions.

Cow Cleaning Machine HAPPYCOW Swing

The special arrangement of the brush in the vertical direction makes the cleaning of the coat at the torso and head easier. The brush rotates in every direction and nearly every angle, so each part of the animal's body (head, torso) can be reached.

The device can be fastened on both sides to ensure even wearing of the bristles. The HAPPYCOW Swing is also equipped with an intelligent control system including a display. A sensor prevents tail hair from getting pulled in and turns the device off automatically.

Furthermore, there is no risk of jumping up as with horizontal brushes!

Cow Cleaning Machine HAPPYCOW

The Cow Scratch Brush HAPPYCOW is a well-established product on the market and has proven itself in the agricultural business over many years.

The Cow Brush turns on automatically when cattle press against the device. A sensor prevents tail hair from getting pulled in and turns the device off automatically. The device is stable and durable, and can be easily installed practically anywhere.

Intensive and pleasant coat cleaning via an extra-thick bristle arrangement. Worn bristle rollers can be easily replaced. You can choose between two types of bristle materials: The new polyamide bristles (PA) are especially supple and kink-free. Polypropylene bristles (PP) have been used successfully for many years.

Optionally available bounce frame

You can select between two bristle materials.
